FEDERAL COMMUNICATIONS COMMISSION 1919 M STREET, N.W. WASHINGTON, D.C. 20554

32451

This is an unofficial announcement of Commission action. Release of the full text of a Commission order constitutes official action. See MCI v. FCC, 515 F 2d 385 (D.C. Circ. 1974).

April 8, 1993

FCC RELEASES SEMIANNUAL STUDY ON TELEPHONE TRENDS

The FCC has released a semiannual report on Trends in Telephone Service. The report is a summary of information collected by the Commission in much more detailed reports.

Among the findings are:

- * In November 1992, the Current Population Survey reported that 93.8% of the nation's households have telephone service.
- * For the year ending in December 1992, the Consumer Price Index for telephone services decreased 0.3%. This reflected an increase in the cost of local services of 0.5%, a decline of 2.4% in the price of intrastate toll calls, and a decline of 1.3% in the price of interstate calling. During the same 12 month period, the nation's overall rate of inflation was 2.9%.
- * About 2.0% of all consumer expenditures are devoted to telephone service -- a percentage that has remained virtually unchanged over the past 20 years despite major changes in the telephone industry and in telephone usage.
- * The volume of long distance calling has doubled since the AT&T divestiture in 1984. By 1991, 14% of calling minutes were interstate and another 12% were intrastate toll calls.
- * By all indications, the number of long distance carriers continues to increase. In December 1992, 394 carriers were reported to purchase the equal access necessary to provide direct distance dialing.

This report is available for reference in the Industry Analysis Division Reference Room, Common Carrier Bureau, 1250 23rd Street, N.W., Plaza Level. Copies may be purchased by calling International Transcription Services, Inc. (ITS) at (202) 857-3800.

INDUSTRY ANALYSIS DIVISION FEDERAL COMMUNICATIONS COMMISSION WASHINGTON, D.C. 20554

MARCH 1993

INTRODUCTION:

This publication summarizes a variety of information on telephone service. In most cases, the reports underlying this summary provide a much greater level of detail. More detailed information is available from the sources listed at the end of the document. Much of the information is also available through an electronic bulletin board that can be reached by dialing (202) 632-1361.

TELEPHONE SUBSCRIBERSHIP:

Under contract with the Federal Communications Commission, the Bureau of the Census includes questions on telephones as part of its Current Population Survey. This survey, which monitors demographic trends between the decennial censuses, has several strengths: it is conducted regularly by an expert agency, the sample is very large, and the questions are consistent. Thus, changes in the results can be compared over time with a great deal of confidence.

Twelve million households have been added to the nation's telephone system since these surveys began in November 1983 -- reflecting both an increase in the total number of households and a small, but statistically significant, increase in the percentage of households that subscribe to telephone service. The Census data also reflect slight, but statistically significant, seasonal variations in penetration rates. This pattern, after allowing for effects of the upward trend in the data, is an increase of 0.3% from November to March, followed by a decrease of 0.2% from March to July, followed by a decrease of 0.1% from July to November.

Because of smaller sample sizes, state-by-state data are subject to greater sampling errors than the national data shown in Table 1. Consequently, the state-by-state data shown in Table 2 are based on annual average penetration rates.

PRICE INDEXES FOR TELEPHONE SERVICES:

The Bureau of Labor Statistics (BLS) collects a variety of information on telephone service as part of three separate programs — the Consumer Price Index (CPI), the Producer Price Index (PPI), and the Consumer Expenditure Survey. The following material illustrates the range of information available on price indexes.

1. Long Term Trends in Price Indexes:

A price index for telephone service was first published in 1935. Since that time, telephone prices have tended to increase at a slower pace than most other prices. Table 3 shows long run changes in the Consumer Price Indexes for all items, all services, telephone services, each of the seven major categories that currently constitute the overall CPI, and several services that are often characterized as being public utilities.

2. Comprehensive Price Indexes:

The CPI index of telephone services is based on a "market basket" intended to represent the telephone related expenditures of a typical urban household. It includes both local and long distance services. Changes in telephone prices tend to lag behind other price changes. Overall inflation in the American economy peaked in 1979 and 1980. In contrast, the price of telephone services rose most rapidly during the years 1981 through 1984. The annual rate of change is shown in Table 4 for the overall CPI (which measures the impact of inflation on consumers) and the CPI for telephone services. In addition, Table 4 shows the Gross National Product fixed weight price index prepared by the Bureau of Economic Analysis (which measures inflation throughout the economy).

3. Price Indexes for Local Service:

The CPI index of local telephone charges is based on a broadly defined "market basket" that includes monthly service charges, message unit charges, leased equipment, installation, service enhancements (such as tone dialing and call waiting), taxes, subscriber line charges, and all other consumer expenditures associated with telephone services except long distance charges. In contrast, the PPI index of monthly residential rates is much more narrowly defined. It is based only on monthly service charges for residential service, optional touch-tone service, and subscriber line charges. It excludes taxes and all other expenditures. The annual rates of change for these indexes of local costs are presented in Table 5.

4. Price Indexes for Long Distance Service:

Consumer price index data is available for intrastate toll and interstate toll services since December 1977. These series are also presented in Table 5. A variety of other more detailed indexes are available in the source materials indicated at the end of this publication.

Table 3
Annual Rates of Change for Various Price indexes*

^{*} CPI toll indexes represent rates for households. PPI toll indexes represent rate changes for both business and residential consumers.

PRICE LEVELS:

1. Local Rate Levels:

The price indexes maintained by the Bureau of Labor Statistics indicate percentage changes in the price of telephone services. The BLS does not publish actual rate levels. Calculations of average rates are based on surveys by FCC staff. These surveys use the same sampling areas and weights used by the BLS in constructing the Consumer Price Index.

Table 6 presents average local rates for residential customers. In October 1992 the national average for flat rate residential service was \$18.66 monthly, including taxes and subscriber line charges.

In most cities, consumers can subscribe to a service with a lower recurring charge than the cost of unlimited one party service. Lower priced service options include party line service and measured service. As of October 1992, the national average for the lowest generally available recurring charge was \$6.24. The average minimum monthly bill, including subscriber line charges and taxes, was \$11.12.

Table 6 also shows rates for a single-line business customer. These rates are representative of the cost of a local access line for small businesses.

2. Long Distance Rates:

In Table 7, AT&T's prices for directly dialed long distance calls are shown for January 1984 and July 1992. Higher charges apply to other types of calls such as those using operator assistance. Lower prices are available through calling plans and other volume discounts. Since 1984, AT&T's charges for directly dialed interstate calls have been reduced about 40%.

^{*} The residential rates shown in this table do not include additional charges for touch tone service.

10

^{**} The representative rate is based on the single—line rate for unlimited service where that service is offered, and the measured service rate plus additional charges for the first 200 five—minute messages in other cities. The representative business rate includes the additional monthly cost for touch—tone service for 1983 through 1987. The additional charge is shown separately thereafter.

^{***} Connection charges do not include drop line and block charges. Residential connection charges do not include additional charges for touch—tone service. Business connection charges for 1983 through 1987 include the additional connection charge for installing touch tone service. The charge is shown separately thereafter.

CONSUMER EXPENDITURES:

The Bureau of Labor Statistics conducts surveys of consumer expenditures, in part, to develop weights for CPI indexes. Table 8 shows expenditures for telephone service for all consumer units. Average annual expenditures on telephone service increased from \$325 per household in 1980 to \$618 in 1991.

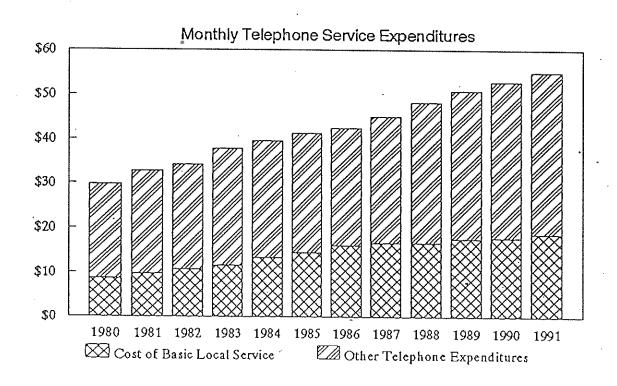

About 2% of all consumer expenditures are devoted to telephone service. This percentage has remained virtually unchanged over the past 20 years, despite major changes in the telephone industry and in telephone usage.

The information on average telephone expenditures can be used to estimate the average monthly bills for households with telephone service. This average was about \$55 per month for 1991. Monthly bills have increased significantly since 1980, but less than half of the increase is due to increased rates. Residential toll calling grew by about 10% a year between 1985 and 1989 a period when toll rates declined dramatically. Additionally, residential toll calling has grown by about 6% a year in the 1990s. The average American household now spends more on long distance service than on basic local service, reflecting the growth in long distance calling since the AT&T divestiture in 1984.

Table 8
Telephone Service Expenditures

	Annual Expenditures (Average for All Households)			Monthly Expenditures (for Households with Telephone Service)					
Year Telephone Percentage of Expenditures Total Expenditures		Basic Local Service Charge *	Toll and Other Telephone Expenditures **	Total Telephone Expenditures

- * Monthly service charges for unlimited local service, taxes, and subscriber line charges.
- ** Primarily toll services. Also includes charges for equipment, additional access lines, connection, touch tone, call waiting, *900* service, directory listings, etc.

STATE TELEPHONE RATE CASES:

The actions of state regulatory commissions provide important indicators of future rate changes. Rate cases completed by the state commissions tend to result in immediate rate changes. At the same time, the amount of rate relief requested by local telephone companies, but not yet acted upon by state commissions, provides an indicator of future rate changes.

At the beginning of 1984, rate cases pending before state public utility commissions totaled nearly \$7 billion dollars. During the first half of that year, state commissions completed action on a number of extraordinarily large rate cases. After 1984, the level of activity in state cases diminished substantially. Beginning in 1987, the dollar amount of rate reductions and refunds ordered by state commissions has usually exceeded the dollar amount of rate increases authorized.

The total amount of rate increases pending before public utility commissions is about \$160 million. Since it typically takes more than a year for a rate case to be completed, the low level of pending cases -- viewed in conjunction with recent reductions ordered by state commissions -- should indicate a low level of rate changes for local and intrastate toll rates during the next year.

CHANGES IN TECHNOLOGY AND EQUAL ACCESS:

Central Office Technology:

During the 1980's, the Bell Operating Companies replaced most of their older "electromechanical" switches with newer equipment. The newer offices use computers to switch calls. In the telephone industry these computers are referred to as "stored program control" switches. Switches with the most current technologies are fully digital. That is, computers are used to switch calls and, in addition, telephone conversations are converted to a digital form before being passed through the switch and later reconverted to their original analog form. Some offices are of an intermediate variety: the switching function is done by computer but the calls continue to be processed in their analog form. The spread of these technologies is shown in Table 10.

The use of digital technology has allowed local telephone companies to equip most of their offices for the provision of "equal access" to competing long distance carriers. Newer signaling systems have been developed that permit calls to be set up more quickly and efficiently. In the late 1980's, telephone company offices began to be converted to the newest system, "Signaling System 7." For several years the telephone industry has been working to develop standards for an Integrated Systems Digital Network (ISDN). One of the attractions of ISDN is that ordinary local telephone lines (copper loops) can transport high speed data between computers and handle more than one telephone conversation at a time. ISDN, however, has not yet been widely deployed. The number of offices and lines equipped for these features are shown in Table 11.

2. Equal Access:

The Bell Operating Companies serve more than 75% of the nation's telephone lines. Under the Modification of Final Judgment that settled the AT&T antitrust case, the Bell Operating Companies are obligated to offer equal access to all long distance carriers. The Bell Operating Companies have converted almost all of their lines to equal access, although there are a few lines at smaller, older offices where equal access is being provided as the offices are converted to more modern equipment. Independent telephone companies, which serve almost 25% of the nation's lines, are converting offices to equal access at a less rapid pace. Overall, about 90% of the nation's telephone lines have been converted to equal access.

3. Data for Individual Companies and States:

The information shown in Tables 10 through 12 is based on special studies completed around 1989 and present a lengthy time series for data not usually available. Much more detailed data is available for individual companies on a state-by-state basis but only for the years 1990, 1991, and 1992. The detailed data can be obtained through the FCC-State Link Bulletin Board. Viewed in the aggregate, the two sets of data give virtually identical results at the national level and, because the differences are so minor, we have not attempted to update the projections shown in Tables 10-12.

^{*} COMPANIES WITH \$100 MILLION IN ANNUAL OPERATING REVENUES.

TELEPHONE LINES AND LOCAL TELEPHONE COMPANIES:

Within the telephone industry there are several alternative, but closely related, definitions of telephone lines or loops. While these differences often make it difficult to easily reconcile data from different statistical series, they are not usually large enough to affect comparisons among companies or trends over time.

Table 13 shows the nation's total number of local loops during each year. With virtually all businesses having telephone lines and more than 90% of the nation's households having telephone service, the growth in the number of lines tends to reflect growth in the population and the economy -- averaging about 3% per year.

There are about 1300 local telephone companies in the United States. Table 14 shows the number of companies and the number of switched access lines in each state.

^{*} This figure overstates the actual number of operating companies because many operating companies serve more than one state. There are about 1300 separate operating companies.

MINUTES OF CALLING:

1. Dial Equipment Minutes:

As in the case of telephone lines, there are many alternative measures of calling volumes. Most subscribers purchase service with unlimited local calling. As a result, most calls are not metered and estimates of total calling are subject to wide margins of error. Periodic studies are used within the telephone industry to estimate the number of calls and calling minutes for a variety of purposes. For example, periodic studies of dial equipment minutes (DEMs) are used to estimate the proportion of calling that is interstate and to allocate costs between interstate and intrastate services.

Dial equipment minutes are shown in Table 15. Dial equipment minutes are measured as calls enter and leave telephone switches. Therefore, two DEM minutes are counted for every conversation minute. The volume of local calls has grown at approximately the same rate as the number of local telephone lines. In contrast, the volume of long distance calling surged as prices fell. As a result, a greater portion of calls are long distance. Intrastate toll minutes increased from 8% of all minutes in 1980 to 12% in 1991. During that same period, interstate calling minutes increased from 8% of the total to 14%.

As shown in Table 16, the average telephone line is used primarily for local calling and is used somewhat less than an hour per day. This level has remained relatively constant for a long period of time despite increases in long distance calling and the introduction of facsimile machines and other devices that affect usage.

2. Access Minutes:

An alternative measure of interstate calling became available in 1984. "Switched access minutes" are those minutes transmitted by long distance carriers that also use the distribution networks of local telephone companies. The measure includes minutes associated with ordinary long distance calls and the "open end" of WATS-like calls. It excludes calls made on private telecommunications systems, on leased lines, and minutes on the "closed end" of WATS-like calls.

Table 17 shows the total number of interstate switched access minutes handled by all long distance carriers. The number of minutes has grown steadily since mid-1984, stemming from a combination of overall economic growth, price reductions, and extensive advertising. Premium minutes have grown rapidly, reflecting both strong underlying traffic growth and the conversion of offices to equal access. Non-premium minutes (minutes handled by AT&T's competitors in areas where equal access has not yet been provided) continue to decline as the process of conversion to equal access continues.

Telephone industry traffic experts usually argue that dial equipment minutes represent the best available information on the proportions of different types of calls while access minutes are the most accurate available data on the volume of interstate calling. However, for reasons that are far from clear, reported changes in access minutes are not entirely consistent with reported changes in dial equipment minutes.

LONG DISTANCE CARRIERS:

Carrier Identification Codes provide information on the number of firms seeking to acquire certain types of interconnecting arrangements with local telephone companies. Any firm that seeks to use "trunk side" connections with local telephone companies is provided a three digit carrier identification code so that traffic can be efficiently routed.

Beginning in 1986, a number of corporations, government agencies and other organizations began to acquire carrier identification codes for their own use, rather than for the purpose of providing telecommunications services to others. After that time, the use of such codes to estimate the number of long distance carriers became less reliable. We believe, however, that the number of firms obtaining these codes provides the best information available on the entry of new firms into the long distance market prior to 1986. The number of firms holding these codes is shown in Table 18.

Table 19 shows several alternative sources of information on the development of long distance carriers. A large share of the firms purchasing access--well over 300 companies--purchase the premium access needed to provide direct dial long distance service.

Table 20 shows the number of long distance carriers that purchase different forms of access from the larger local telephone companies in each state. "Feature Group A" access requires a customer to dial a local telephone number to reach a long distance carrier. "Feature Group B" access involves dialing a seven digit number that begins with "950". "Feature Group D" access is the premium access used by major carriers to provide "1-plus" dialing. Within any state, a carrier purchasing access may concentrate its efforts in serving only a few exchanges or a small portion of the state. Thus, the number of carriers available to a particular customer will tend to be smaller than the number of long distance carriers that purchase access somewhere in the state. No data is available for Alaska, which is not served by any of the reporting local companies.

Most small long distance carriers purchase access in only one state, providing nationwide service from the area in which they operate by reselling services purchased from other carriers. Table 21 shows the evolution of larger carriers that purchase equal access.

In January 1991, about 300 providers of operator services filed tariffs as required by the Telephone Operator Consumer Services Improvement Act of 1990. About 50 of these tariffs were

filed by long distance carriers that have been identified as purchasing access or having presubscribed lines. The remaining tariffs were filed by firms we had not previously identified. Thus, it appears that most firms providing operator services are operating as resellers without purchasing access. At the same time, most of the carriers purchasing access in order to provide long distance service do not appear to provide operator services.

LONG DISTANCE MARKET SHARES:

Minutes of Interstate Calling

Measures of switched access minutes first became available in 1984 and were shown in Table 17. Such information is publicly available for the total industry and for AT&T but not for other carriers. Thus, access minutes can be used to compute a market share for AT&T but not for smaller carriers.

Since 1984, interstate calling has grown at an annual rate of more than 10%. AT&T's traffic has grown at a rate slower than the industry average and the remaining traffic, handled by all other carriers, grew at a rapid rate.

The result of an AT&T growth rate slower than the industry average has been a declining market share for AT&T. AT&T's market share is shown in Table 22. AT&T's share of the interstate market, measured in minutes, declined from over 80% in late 1984 to 60% by the end of 1992. At the same time, its share of the equal access market, which was 100% prior to the implementation of equal access, has also declined to about 60%.

2. "Presubscribed" Lines

Telephone lines are said to be "presubscribed" to the long distance carrier that receives the ordinary long distance calls placed on the line. Where equal access is available, each customer is asked to choose a long distance carrier. Thereafter, all of the customer's long distance calls will be routed to the chosen long distance carrier unless the customer alters normal dialing procedure -- for example, accessing an alternate long distance carrier by dialing special codes. Where equal access is not yet available, the use of long distance carriers other than AT&T usually requires dialing a 7 digit local telephone number and entering a personal identification number.

The National Exchange Carrier Association (NECA) provides information on the number of lines presubscribed to each long distance carrier. NECA collects the information from each local telephone company in order to comply with FCC rules that require NECA to recover certain expenses from the larger long distance carriers. This information is shown in Table 23.

NECA reports that, in June 1992, there were 136 million presubscribed lines in the United States. Special access lines, WATS lines, and other specialized lines are not included in the counts of presubscribed lines. The number of lines presubscribed to AT&T has remained roughly constant while the number of lines

presubscribed to other carriers has grown. During 1992, about 74% of these lines were presubscribed to AT&T, 14% to MCI, and 6% to US Sprint. About three hundred smaller carriers, serving nearly 8 million lines, account for the remaining 6% of the industry.

AT&T's percentage of lines is higher than its share of revenues or minutes because all lines in areas that do not yet have equal access are counted as AT&T lines. Also, many customers who make few long distance calls have not chosen an alternative carrier and, as a result, the number of calls per customer line is lower for AT&T than for other carriers.

Toll Revenues

Long distance telephone companies with over \$100 million in annual revenues report their annual revenues to the FCC. The revenues reported include both interstate and intrastate revenues. For most carriers, no information is available that separates interstate from intrastate service. In 1991, services provided by long distance carriers generated more than \$55 billion in revenues. During the past few years, revenues have grown at a far slower pace than the volume of long distance calling because of sharp price cuts. Indeed, AT&T's total toll revenues have declined slightly since 1985 because the growth in calling volume was not sufficient to offset the effect of lower prices.

Long distance revenues are shown in Table 24. During 1984, AT&T's toll revenues of \$35 billion accounted for about 90% of the revenues received by all long distance carriers. By 1991, with its revenues virtually unchanged, its share of total revenues had fallen to about 62%.

The largest local telephone companies, which provide a substantial amount of intrastate toll service, also file annual reports with the Commission. The total toll market, including the short haul toll traffic handled entirely by local telephone companies, exceeded \$69 billion in 1991, with AT&T accounting for about half of the total.

Chart 1 compares alternative measures of AT&T's market share using minutes, lines and revenues. In that chart, a second measure of revenues has been added. The alternative measure is based on financial reports to stockholders. Revenues reported to the FCC usually differ from revenues reported to stockholders. The largest differences tend to relate to the treatment of access charges and international settlements—accounting for the difference between the annual revenue share points labeled "FCC" and the revenue share line labeled "SEC" in Chart 1.

SOURCES: LOCAL EXCHANGE CARRIER INFORMATION DERIVED FROM USTA ANNUAL REPORTS.

AT&T COMMUNICATIONS AND ALASCOM - STATISTICS OF COMMUNICATIONS COMMON CARRIERS.

OTHER COMPANIES:

1981-1982; ANNUAL REPORT FORM P.

1983 -- 1991: AS REPORTED PURSUANT TO FCC REPORT AND ORDER IN CC DOCKET 83-1291.

1/ MCI TELECOMMUNICATIONS AND TELECOM*USA MERGED DURING 1989. INFORMATION FOR 1990 IS COMBINED,

2/ IN JULY 1986, GTE SPRINT AND US TELECOM MERGED AND BECAME KNOWN AS US SPRINT. THE INFORMATION SHOWN FOR GTE SPRINT AND US TELECOM FOR 1986 IS FOR JANUARY 1 - JUNE 30. THE INFORMATION SHOWN FOR US SPRINT FOR 1986 IS FOR JULY 1 - DECEMBER 31.

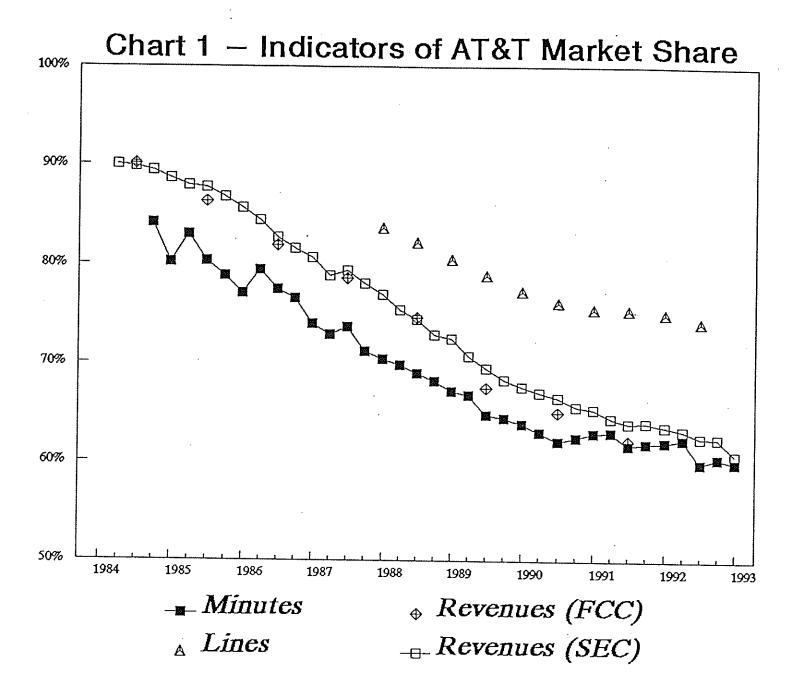

3/ METROMEDIA COMMUNICATIONS CORP. AND ITT COMMUNICATIONS CORP. MERGED DURING 1988. INFORMATION FOR 1989 WAS REPORTED SEPARATELY; INFORMATION FOR 1990 IS COMBINED.

4/ ALLNET AND LEXITEL MERGED AT THE END OF 1985, INFORMATION FOR 1986 IS COMBINED.

5/ TELESPHERE NETWORK, INC., AND NATIONAL TELEPHONE SERVICES, INC., MERGED DURING 1989. INFORMATION FOR 1990 IS COMBINED. AS OF DECEMBER 31, 1991, TELESPHERE NETWORK, INC., WAS IN BANKRUPTCY PROCEEDINGS. THEIR LONG DISTANCE OPERATIONS WERE ACQUIRED BY WILLIAMS TELECOMMUNICATIONS GROUP, INC.

6/ ESTIMATED BY FCC STAFF.

7/ WHILE TOTAL TOLL REVENUES ARE AVAILABLE PRIOR TO 1984, THE MANNER IN WHICH THEY WERE DIVIDED BETWEEN THE BELL SYSTEM AND OTHER TELEPHONE COMPANIES MAKES IT IMPOSSIBLE TO ACCURATELY DETERMINE THE AMOUNTS BILLED BY WHAT IS NOW AT&T COMMUNICATIONS, THE BELL COMPANIES, AND OTHER TELEPHONE COMPANIES.

LIFELINE ASSISTANCE PROGRAMS:

The FCC has established two types of assistance programs for low income subscribers. Programs of the first type are designed to assist poor subscribers in affording the monthly costs of service, and are called "lifeline" plans. Other programs — connection assistance or "Link-Up" programs — are designed to help low income subscribers defray installation charges in order to begin receiving telephone service. Participating states have wide latitude in selecting means tests and shaping the benefits of the programs. By early-1993, programs had been established in 48 states, the District of Columbia, the Virgin Islands, and the Commonwealth of Puerto Rico. The states with each type of program are indicated in Table 25, along with the year during which a program was first certified.

CELLULAR TELEPHONE SERVICE:

The Federal Communications Commission licenses cellular telephone companies but does not impose reporting requirements on the cellular industry. The Cellular Telecommunications Industry Association periodically publishes summary information on their industry, a selection of which are shown in Tables 26 and 27.

The information in this report and, in many cases more detailed information, can be obtained from an electronic bulletin board by calling 202-632-1361.

Printed copies of statistical reports are available in the Industry Analysis Division's Public Reference Room (Room 10 at 1250 23rd Street, N.W.) and from the Commission's duplicating contractor (International Transcription Services, Inc. (ITS) 202-857-3800).

Additional information on regulated carriers, including investments, revenues, expenses, and earnings, is contained in the annual <u>Statistics of Communications Common Carriers</u>, available from the U.S. Government Printing Office.

FCC rules require carriers to provide more data about international telephone service than about domestic service. Because of delays in international settlements, such information is typically received by the commission much later than domestic data and is usually published separately.

The information on cellular telephone service shown in Table 26 was prepared by the Cellular Telecommunications Industry Association (1133 21st Street N.W., Washington, D.C. 20554, (202) 785-0081).

The United States Telephone Association represents virtually all local telephone companies (900 19th Street N.W., Washington D.C. 20006 -- (202) 835-3100). Like many trade associations, it collects information from each of its members. Annually, it publishes and sells statistical publications such as <u>Phone Facts</u> and <u>Statistics of the Local Exchange Carriers</u>.

Two widely used sources of names, addresses and other information for companies in the telephone industry are Telephony's <u>Directory & Buyers' Guide for the Telecommunications Industry</u> and the <u>Telephone Engineer and Management Directory</u>.

For more information, the following individuals may be contacted at (202) 632-0745:
